Film: The River That Harms

(Dir. Colleen Keane, 45 mins, 1987, United States)
This film documents the largest radioactive waste spill in U.S. history - a national tragedy that occurred on Diné (Navajo) lands that received little attention. With the sound of a thunderclap, 94 million gallons of radioactive waste broke through a United Nuclear Corporation storage dam in 1979 and poured into New Mexico's Puerco River, the main water supply for the Diné people and a tributary of the major source of water for Los Angeles, California. To the Diné people, this event impacted their lands, their health and their economy and sends a prophetic warning for all humanity.
